

FDC 4, 5, 5 Wide & 8 FREESTANDING STOVE RANGE

V2

4, 5, 5 & 8 kW Nominal Outputs

With Patented **TTi** Air System

Installation and Operating Instructions

Please hand these instructions to the stove user when the installation is complete. Leave the stove ready for operation and instruct the user in the correct use of the appliance and operation of controls.

Important: – These products must be installed by a suitably qualified installer.

DEFRA Clean Air Act Exemption

The **FDC5, FDC5W & FDC8** stoves only have been exempted under the Clean Air Act 1993 to burn seasoned wood logs in designated smokeless zones in the UK. This is subject to the correct fitting of the air control plate (the part and fitting instructions are supplied separately) maintaining the air wash control at a minimum opening at all times. **Instructions for wood burning MUST be followed in order to ensure compliance at all times.**

FDC (UK) LIMITED
Unit C4, Dinton Business Park
Catherine Ford Road
Dinton, Salisbury
WILTSHIRE
SP3 5HZ

T: 01722 716 161

F: 01722 716 162

e: sales@fdcsalisbury.co.uk

PLEASE READ ALL THESE INSTRUCTIONS CAREFULLY!

For safety reasons it is essential that your stove is correctly installed and operated. FDC Stoves cannot accept responsibility for any fault or consequential problems arising through incorrect installation or operation.

Fig 2 – FDC4, FDC5, FDC5W, FDC8 Stove Assembly and Controls. FDC5 Model Shown

2. Component Identification and Assembly

Your stove comes packed in a plywood crate. Carefully remove the straps and lift off the upper crate. Remove any plastic packaging, open the door and remove all the contents. **THE DOOR HANDLE MAY BE PACKED ON TOP OF THE BAFFLE PLATE – REACH THROUGH THE TOP SPIGOT OPENING TO FIND IT. See List of Components section and check contents carefully.**

- 2.1 To remove the baffle plate, first remove the two stainless steel side firebox liner clips by lifting them above the fuel retainer. Remove the two firebox side liners. Now remove the firebox rear liner. Handle & store very carefully to one side where they will not get broken.
- 2.2 Remove the front fuel retainer by lifting up and rotating until it can be lifted through the open door of the firebox.
- 2.3 Now the baffle plate can be removed by lifting off its supports and bringing out through the firebox door opening.
- 2.4 Fit the flue spigot collar to the top or rear outlet (as required for the installation) using the 4 x M6 screws and washers supplied. Use 3mm ceramic gasket provided or fire cement to seal.
- 2.5 Fit the blanking plate to the opening that is not required for use using the 4 x M6 screws and nuts provided. Thread each nut on to the screw first and then insert the screw through the fixing hole into the blind hole in the blanking plate until tight. Now

- screw up the nut on the thread to compress the gasket and seal the blanking plate to the stove. Use 3mm ceramic gasket provided or fire cement to seal.
- 2.6 Now proceed to install the stove according to these instructions and current installation standards or HETAS advice. The internal parts of the stove can be re-assembled as the reverse of the previous removal instructions.

3 Installation Instructions

3.1 WARNINGS AND IMPORTANT SAFETY INFORMATION

3.1.1 READ THESE INSTRUCTIONS CAREFULLY BEFORE INSTALLATION!

These instructions cover the basic principles to ensure satisfactory installation of the stove, although detail may need slight modification to suit particular local site conditions. In all cases the installation must comply with current local regulations including Building Regulations, Local Authority Byelaws and other specifications or regulations including UK or EU standards referred to as they affect the installation of the stove. Approved Document J is particularly important for England and Wales and can be downloaded for no cost at:

<http://www.planningportal.gov.uk/england/professionals/en/400000000503.html> Also of importance are Approved documents L1 A and B conservation of fuel and power. The Domestic Heating Compliance Guide will also be found useful.

In addition to these instructions the requirements of BS 8303 and BS EN 15287 must be fulfilled. The installation is a notifiable building works as defined in the building regulations and that it is a legal requirement under England and Wales Building Regulations that the installation is either carried out under Local Authority Building Control approval or is installed by a Competent Person registered with a Government approved Competent Persons Scheme. HETAS Ltd operate such a Scheme and a listing of their Registered Competent Persons can be found on their website at www.hetas.co.uk.

3.1.2 Important Chimney Warning

This stove must not be installed into a chimney that serves any other heating appliance.

3.1.3 Extractor Fan Warning

There must not be an extractor fan fitted in the same room as the stove as this can cause the stove to emit fumes into the room. If unavoidable the appliance must be checked with A.D. 1.21 and necessary action taken.

3.1.4 Cleaning and Chimney Sweeping

The appliance, flue & chimney must be cleaned and checked internally and externally regularly in use and especially after a period of disuse (e.g. after summer). Lift down the baffle at least weekly to check for build up of soot or debris on the top from the flue pipe. A slot is provided in the front edge of the baffle plate for the multi tool to prevent the need to get hands dirty doing this job. Remove the baffle and check the flue spigot and connector is fully clear at regular intervals. The chimney and flue connector must be swept at least annually, more often when used with sooty fuels or damp wood. A wire centred sweeps brush with guide wheel is recommended. Any loose, broken or leaking joints or flue ways **MUST** be repaired immediately.

3.1.5 Fuels

Only use recommended fuels which are seasoned (or kiln dried) wood logs or smokeless briquetted fuels. The appliance can be damaged by burning petroleum coke, liquid fuels or general rubbish and this will invalidate your warranty and risk your personal safety. **The appliance must not be used as a rubbish incinerator.**

3.1.6 Maintenance

Annual checking and servicing of the appliance and flue by a competent engineer is recommended.

3.1.7 Ventilation

Adequate ventilation is ESSENTIAL for the safe and efficient operation of any solid fuel or wood burning appliance. Ventilation MUST be provided where required by the stove output or flue under-performance. Keep all ventilation clear and free of blockage. SEE VENTILATION in INSTALLATION section.

Health And Safety Precautions

Special care must be taken when installing this stove to meet all requirements of the Health & Safety at Work act.

3.1.8 Handling

Adequate facilities must be available for unloading and site handling. FDC Stoves are very heavily built so always ask for assistance when lifting and siting the stoves.

3.1.9 Fire Cement

Some types of fire cement are caustic and should not be allowed to come into contact with the skin. In case of skin contact, wash immediately with plenty of water.

3.1.10 Asbestos

This stove contains no asbestos. If there is a possibility of disturbing any asbestos in the course of installation then please seek specialist guidance and use appropriate protective equipment.

3.1.11 Metal Parts

When installing or servicing this stove, proper care should be taken to avoid the possibility of personal injury.

4.0 Installation Information

4.1 Chimney

The chimney height and the position of the chimney terminal should conform to Building Regulations. Minimum chimney height is 4.5m. Check that the chimney is in good condition, dry, free from cracks and obstructions. The diameter of the flue should not be less than 150mm and not more than 200mm. If any of these requirements are not met, the chimney should be lined by a suitable method. The chimney must be swept before connection to the stove.

Where the chimney is believed to have previously served an open fire installation, it is possible that the higher flue gas temperature from the stove may loosen deposits that were previously firmly adhered, with the consequent risk of flue blockage. It is therefore recommended that the chimney be swept a second time within a month of regular use after installation.

If you have any doubts about the suitability of your chimney, consult your local dealer/stockist or chimney specialist. If there is no existing chimney then either a solid fuel compatible prefabricated block chimney or a twin-walled insulated stainless steel flue to BS 4543 can be used. These chimneys must be fitted in accordance with the manufacturer's instructions and Building Regulations.

4.2 Ventilation

Purpose provided ventilation is not required in England and Wales unless the appliance nominal rated output is greater than 5kW. Over 5kW 5.5 cm² of ventilation (550mm²) is required for every kW output above 5. For example 6.5 kW requires 8.25 cm² and 8 kW needs 16.5cm². In any case, if difficulty in starting the fire or any fuming is experienced, ventilation must be put in place as required to eliminate these flue problems. If a flue draught stabiliser is fitted then extra ventilation is required. See Document J of the Building Regulations for detailed guidance especially in new build properties where permanent fixed ventilation is likely to be required.

4.3 Flue Draught

A flue draught of minimum 1.2mm to a maximum 2.5mm water gauge (12 to 25 Pascals) is required for satisfactory appliance performance. When this is measured at the flue spigot collar it equates to 22 Pascal's MINIMUM to approximately 35-40 maximum. The flue draught should be checked under fire at high output and, if it exceeds the recommended maximum, a damper or draught stabiliser must be fitted so that the rate of burning can be controlled to prevent over-firing.

4.4 Connection to the Chimney

This appliance is **not** suitable for use in a shared flue.

When using a liner a 5" flexible flue liner is permitted be used on the FDC 5& 5W models providing that they only burn smokeless fuel or seasoned wood logs with the air limiter fitted in in full accordance with the wood burning instructions.

An existing fireplace opening can be bricked up or sealed with a register plate. A short length of flue pipe of a minimum 125mm internal diameter (150mm min where the flue spigot socket is 150mm diameter) may then be used to connect the stove to the chimney. A maximum of 150mm horizontal flue pipe can be used. This flue pipe should conform to Building Regulations. Ensure that the pipe end is no closer than 76mm to the side or rear chimney walls.

There must be a smooth streamlined entry into the flue way and there must be no voids, particularly those that might accumulate soot and debris leading to blockage and/or chimney fire risk. It is essential that all connections between the stove and chimney-flue are sealed and made airtight with sealing rope, screws, clamping rings and/or fire cement or suitable heat resisting cement/sealant where required.

Both the chimney and flue pipe must be accessible for cleaning and if ANY parts of the chimney cannot be reached through the stove (with baffle removed), a soot door must be fitted in a suitable position to enable this to be done.

4.5 Material Clearances

Safety Distances from Combustible Surfaces:

Model	Side	Rear
FDC4	500mm	750mm
FDC5	750mm	800mm
FDC5W	600mm	800mm
FDC8	750mm	850mm

In addition it is strongly recommended that any furniture or other combustible materials are kept at least 900mm clear from the front of the stove.

Combustible Shelves and Beams

Due to the fact that combustible shelves, timber fireplaces and beams have potentially thousands of possible configurations in conjunction with stoves that are outset or inserted partially or fully into chambers, it is not possible to give firm guidance on dimensions to these features. As a guideline, materials that are in 'line of sight' to the stove are more likely to overheat due to direct radiation from the stove body than materials that are not in 'line of sight' (e.g. with stove fully inside a chamber). Materials above the stove are more likely to overheat than materials alongside or below. A guideline limiting temperature for solid timber (not surface finishes) is approximately 80-85 degrees C with a normal ambient room temperature. Temperatures of combustible materials can be substantially lowered with a simple heat shield constructed of a non-combustible material and small air gap between the shield and combustible material.

Distances from NON-combustible materials:

The stove can be recessed in a suitable sized non-combustible fireplace but a permanent free air gap of at least 50mm must be left around the sides and top and at least 50mm at the back of the stove to obtain reasonable heat output and for access to the stove for removal and maintenance. A clearance of 150mm will give a better heat output. A clearance of 120mm is desirable on the right side of the stove to fully operate the grate de-ashing mechanism.

All non-combustible walls closer than 400mm to the stove should be at least 75mm thick. For practical reasons the back wall of the fireplace recess and the hearth should ideally be made of non-combustible material.

4.6 Hearths:

These freestanding stoves do not require a constructional hearth beneath them as they do not cause the floor temperature to exceed 100 degrees C. **Note:** the solid fuel hearth heat shield supplied fitted beneath the stove must remain in place when using smokeless or any coal fuels to ensure compliance with this requirement – this part is supplied pre-fitted under the stove body. Hearths must be level and square to any back panel or the wall. In any case a non-combustible superimposed hearth extending fully underneath the stove and forming an apron of at least 225mm at the front of the stove and 150mm on either side must be provided. The superimposed hearth must not be less than 12mm thick and must have a clearly defined edge (change of level) to discourage placing of any combustible materials on or partially over it.

The appliance shall be installed on a floor with adequate load-bearing capacity. If the existing construction does not meet this requirement, suitable measures (e.g. load distributing plate) should be provided to achieve it.

4.7 Commissioning and Handover

A CO detector must be fitted in the same room as the stove according to current standards or codes of practice. Advise the customer of the importance of this device and maintaining it.

If the stove is to be used with smokeless fuel exclusively then the rear air box sealing rope may be fitted to the stove according to the instructions supplied with it. This closes the tertiary air intake off as it is not required for briquetted smokeless fuel. DO NOT fit the seal if burning any wood or a mix of wood and smokeless coal.

Upon completion of the installation, allow a suitable period of time for any fire cement and mortar to dry out. A small fire may then be lit and checked to ensure the smoke and fumes are taken from the stove up the chimney and emitted safely to atmosphere.

Advise the customer not to run the stove at full output for at 3 – 4 days. Explain that the stoves can provide much more or less than their rated heat outputs depending upon how they are burnt and the fuels and fuel loads used.

Warn the customer that using excessive air (having the air controls open too wide for too long) can over-fire and irreparably damage the stove. Damage caused by over firing is NOT covered by any warranty.

On completion of the installation and commissioning, check all parts of the appliance are correctly fitted and ensure that the operating instructions and operating tools (including gloves) for the stove are left with the customer. You must be sure to advise the customer on the correct use of the appliance with the fuels likely to be used on the stove and warn them to use only the recommended fuels for the stove.

Advise the user on what to do should smoke or fumes be emitted into the room from the stove – see **Safety Notes** section. The user should be warned that they MUST use a suitable fireguard in the presence of children, aged and/or infirm persons.

5.0 Technical Data - Declaration of Performance (DoP)

Manufacturer: Fireline UK Ltd, a Division of Charlton & Jenrick Ltd.

Range Designation: FDC Freestanding Stoves.

Models: FDC4, FDC5, FDC5W, FDC8 with nominal outputs of 4kW, 5kW, 5kW and 8kW.

Intended Use: Domestic heating appliances

Independently Performance & Safety tested by: Kiwa Gastec, Notified Body No: 0558

Constancy of Performance System: ISO9001

Model	FDC4	FDC5	FDC5W	FDC8	Notes
Appliance weight (packed/unpacked) (Kg):	59/40	74/63	78/69	90/78

May 2015

NOTE: Refuelling intervals for testing are chosen according to the standards concerned for performance testing and are comparative only. They **do not** relate directly to re-fuelling intervals that can/might/will be achieved on an installed product. Re-fuelling intervals of 1-1.5h for wood and 3-4+ hours for Ancit would be more usual. Under normal conditions on a low air control setting stoves should stay in overnight on suitable briquetted smokeless fuel.

6.0 Operating Instructions

This appliance is not designed for open operation and therefore should **not** be operated with the doors open.

This stove is designed to burn wood and smokeless fuels cleanly with high efficiency. However, for this product to work properly it must be used correctly. If used correctly this stove will burn with the very useful feature of clean glass.

It is **essential** that the stove has an adequate air supply for combustion and ventilation. DO NOT block any ventilators provided. The primary, secondary and tertiary air inlets must be kept clear from obstruction.

Warning! This appliance will be very **hot** when in operation and due care should be taken when operating the controls. A tool and pair of high quality leather gloves are provided to assist safe operation.

Do not use an aerosol spray on or near the stove when it is alight.

6.1 The Clean Air Act 1993 and Smoke Control Areas

Under the Clean Air Act local authorities may declare the whole or part of the district of the authority to be a smoke control area. It is an offence to emit smoke from a chimney of a building, from a furnace or from any fixed boiler if located in a designated smoke control area. It is also an offence to acquire an "unauthorised fuel" for use within a smoke control area unless it is used in an "exempt" appliance ("exempted" from the controls which generally apply in the smoke control area).

The Secretary of State for Environment, Food and Rural Affairs has powers under the Act to authorise smokeless fuels or exempt appliances for use in smoke control areas in England. In Scotland and Wales this power rests with Ministers in the devolved administrations for those countries. Separate legislation, the Clean Air (Northern Ireland) Order 1981, applies in Northern Ireland. Therefore it is a requirement that fuels burnt or obtained for use in smoke control areas have been "authorised" in Regulations and that appliances used to burn solid fuel in those areas (other than "authorised" fuels) have been exempted by an Order made and signed by the Secretary of State or Minister in the devolved administrations.

The FDC5, FDC5W and FDC8 have been recommended as suitable for use in smoke control areas when burning wood logs. **This is conditional upon fitting the supplied secondary air control (air wash) limiters and following the wood burning instructions precisely.**

Further information on the requirements of the Clean Air Act can be found here: <http://smokecontrol.defra.gov.uk/>. Your local authority is responsible for implementing the Clean Air Act 1993 including designation and supervision of smoke control areas and you can contact them for details of Clean Air Act requirements.

6.2 Air Controls

Keep air controls clean and free from ash or debris at all times.

Primary Air

Primary air is controlled via the rotary air control on the bottom of the door.

This provides a conventional air under draught to the bed of the fire. The primary air intake needs to be adjusted to give the best results when burning different fuels. It will usually be fully closed when burning wood fuel and some way open when burning smokeless coal type fuels.

Secondary Air (Air Wash)

FDC stoves are provided with a sophisticated patented “air wash” system. This secondary air supply to the stove is controlled through a slider assembly located on the centre of the stove above the door. If you want clean glass, always leave this control open some way whilst burning unless the stove is being shut right down for a long period. The only time this control should be fully closed is for maximum efficiency on Ancit fuel or for very slow burning on wood. The DEFRA air restrictor will deliberately prevent full closure of this control. The air wash control knob is mounted on a thread and should be screwed up tight and then unscrewed until it just slides freely. If the knob is allowed to get too loose it will allow air around the sides of the slider and render it only partly effective – simply re-tighten. The knob can be tightened fully to secure the slider in a particular position as required.

Tertiary Air

This appliance is also fitted with a draught controlled tertiary air system that burns otherwise uncombusted gasses in the products of combustion thereby improving efficiency, increasing heat output and decreasing unwanted atmospheric emissions. The Tertiary air supply to the stove is controlled entirely by the draught in the flue and firebox. At certain stages of burning you will notice “jets” of flame emerging near the air holes to the rear of the firebox. For maximum efficiency on Ancit fuel the amount of tertiary air needed is greatly reduced and so on some models a seal is provided to be mounted inside the rear air box to restrict it for maximum efficiency – if burning exclusively smokeless fuel. Do not use the seal if the fuel is changed to wood again or mixed fuel is being burnt.

Multifuel Grate

Your stove is fitted with a multifuel grate, which can be de-ashed from the right side of the stove by pulling and pushing the knob to rotate the centre section of grate. The grate is a strong set of cast iron bars with suitable air slots that assist the burning of most fuels. When burning coal type fuels it is important to use the rotary grate and a poker where required to de-ash regularly to ensure that the primary airflow is not impeded, as a build-up of ash *when burning coal* can damage the cast iron grate. A build up of wood ash when burning wood will not harm the grate and indeed wood is said to burn better on a bed of ash. Excessive wood ash build up is not to be recommended, however.

Ashpan

It is essential that you empty the ash pan regularly when burning coal type fuels. Use the flat end of the tool to lift the ash pan out of the stove. DO NOT allow coal ash to build up underneath the bed as this may cause damage to the grate.

6.3 Cleaning

Glass: Despite the advanced air wash system provided, the glass will still need cleaning from time to time depending on the fuel quality and burning rates used. Never clean glass when the stove is hot. Always use stove glass cleaner or ceramic hob cleaner, which is available from your stove retailer or supermarket. As an alternative, use a wet cloth with some of the wood ash if burning wood but be very careful to use very soft clean ash so as not to scratch the glass. DO NOT use coal ash to clean the glass.

Outer body: The outer body simply needs to be dusted from time to time. DO NOT use any kind of furniture polish or cleaning agent other than your stove suppliers recommended paint.

Inner firebox: Brush the inside of the firebox clean from time to time to check the integrity of the plates and liners etc. It is not normally necessary to re-paint inside the firebox due to the high temperatures that mean that the paint does not have much effect before being burnt off. Steel and cast ceramic liners are resilient firebox materials and will give reliable service without major cleaning or work on the firebox. The liner boards may require replacement occasionally during the stove's life depending upon fuels and the type of usage experienced. Firebox liners are not covered by warranty, as they are a wearing consumable part.

Baffle: It is essential to check the top of the baffle for build up of soot and ash regularly when in use and after a long period of no use. From time to time remove the baffle if necessary to ensure that the flue way entrance is clear. A slot is provided in the front edge of the baffle for lifting down with the multi tool for quick and easy checks without getting dirty hands.

6.4 Fuels

The appliance is fitted with a versatile multifuel grate and the appliance has been tested and approved burning dry, well-seasoned logs or Ancit or equivalent smokeless fuel. These are the recommended fuels. For other fuels please contact the manufacturer for advice. Petroleum coke must never be burnt on this appliance – it is likely to damage the grate and other parts.

6.5 Important Notes for Wood Burning

With a full load of wood, the stove will need to be refuelled approximately every 1-1.5 hours. Wood can be stacked higher in the stove than solid mineral fuel but care must be taken that logs do not touch the baffle or the glass panel. **Do not stack logs above the level of the tertiary air inlets at the back of the stove.**

Wood burns most efficiently with the primary air controls closed and the secondary (air wash) controls a small amount open. Carefully adjusting the fuel load and secondary air controls will then control the burn rate of the stove. Always make sure that flames are visible and maintained above the wood after re-fuelling for cleanest burning. **After re-fuelling open the air wash full for 3 to 5 minutes or until the logs are fully blackened to achieve full flames above the fuel.**

Wood burns well on a bed of ash and it is therefore only necessary to remove surplus ash from the stove occasionally.

Burn only dry, well-seasoned wood, which should have been cut, split and stacked - under protection from rain - for at least 12-24 months with free air movement around the sides of the stack to enable it to dry out. Burning wet or unseasoned wood will create tar deposits in the stove and chimney and will not produce a satisfactory heat output. **Wood that is not properly dry ('dry' is considered to be less than 20% internal moisture content) uses up energy from the burn process to evaporate the water inside the wood thus creating very poor conditions for combustion.** By far the most common cause of burning problems with wood stoves is due to excessively damp wood. Wood can appear perfectly dry on the outside but still contain 40-50% water on the inside. A moisture meter can be purchased from some stove and equipment suppliers or online if you wish to check your wood source is correct.

6.5.1 Refuelling on to a low fire bed

If there is insufficient burning material in the firebed to light a new fuel charge, excessive smoke emission can occur. Refuelling must be carried out onto a sufficient quantity of glowing embers and ash so that the new fuel charge will ignite in a reasonable period. If

there are too few embers in the fire bed, add suitable kindling to prevent excessive smoke.

6.5.2 Fuel overloading

The maximum amount of fuel specified in this manual should not be exceeded, overloading can cause excess smoke.

6.5.3 Operation with door left open

Operation with the door open can cause excess smoke and spillage into the room. The appliance must not be operated with the appliance door left open.

6.5.4 Primary Air left open

Operation with the primary air controls left open can cause excess smoke. The appliance must not be operated with air controls or door left open.

6.6 Notes on Smokeless Fuel (Ancit) burning

Ancit, smokeless and coal type fuels require very different burning conditions to log burning and the controls can be used to maximise efficiency on any fuel. When the stove is established and burning well, the air wash can be closed fully and the burning rate controlled with the primary air control and refuelling to obtain maximum efficiency. Ancit and other smokeless briquetted fuels can burn with very little primary air and stay in for many hours. A hearth heat shield for superimposed hearths is supplied ready fitted underneath the stove and must be left in place when a superimposed hearth is used.

6.7 Lighting the Stove

We recommend that you have two or three small/medium fires before you operate your stove to its maximum heat output. This is to allow the paint to cure steadily and to give a long service life of the paint finish. During this curing in process you may notice an unpleasant smell whilst the finishes finally cure. It is non-toxic, but for your comfort we would suggest that during this period you leave all doors and windows open.

First, open the secondary air wash control fully. Then load the firebox with plenty of starting fuel, i.e. paper, dry kindling sticks and/or firelighters. If using Ancit, place a layer of ancit into the firebox as well and open the primary air fully. Light the fire at the base leaving the secondary air control fully open (and primary for Ancit). Leave the door slightly ajar for 10 minutes (usually less for Ancit) to enhance initial starting and reduce smoke emission – DO NOT leave the stove unattended if the door is left ajar. Allow the fuel to reach a steady glow and build the fire up gradually by adding a few small sticks, well split logs or Ancit briquettes at a time. Once you have a good fire bed established across the grate, further fuel can be added step by step as required. Don't be tempted to overload the fire bed with fuel all at once or close down the air controls too much until the fire is really well established for some time. Once the ignition period is well under way, gradually reduce the air control opening to establish the burning intensity you require. For smokeless fuels have the air wash slider virtually closed with primary air used to control the burning rate. For Wood have the primary air closed with the air wash used to control the burning rate.

6.8 Re-fuelling

When burning Ancit the fire will begin to die down with a significant amount of white ash showing amongst the fuel. Shake the grate using the de-ashing knob and then *gently* run a poker through the fire bed to remove most of the ash into the ashpan. Empty the ashpan if it is nearly full and then re-fuel with a good load of briquettes. The fuel load should initially be level with the top of the fuel retainer and not above the rear firebox

liner top. Whilst approval test cycles are 2 hours, a stove burning Ancit or equivalent fuel may be kept in over night easily.

When burning wood, the fire will die down as the fuel is consumed. When the flames disappear and the remainder is breaking down into glowing embers it is an appropriate time to consider re-fuelling. NOTE: If the flames disappear and there are still lumps of solid wood left this indicates excessive internal moisture in the wood or insufficient air supply or flue draught.

NOTE: To eliminate unwanted smoke emission, after loading new logs on to the fire, open the air wash control up fully for 3-5 minutes or until the logs are blackened all over to boost the fire and get flames issuing from the top of the fuel as soon as possible. When flames are well established, reduce the air wash to the running setting required. **Burning without flames above the fuel will create unnecessary smoke.** Do not load fuel above the tertiary air inlet holes at the back of the firebox.

Loading 2 to 4 large/medium sized logs will produce a good output with reasonable burn time, generally small logs will burn up quicker producing a high output for a short time and a large log will take longer to burn and produce less output over a given time. These appliances are approved for intermittent operation on wood (0.75 to 1.5 hour burn cycles) although much longer burn times can be achieved by fully loading the firebox, getting the fuel burning well and then shutting the air controls right down (see below). The fire will then need reviving by first opening the air controls and then using small pieces of wood and plenty of air to get flames issuing from the wood again. The glass will likely black up due to the air wash being closed down fully.

6.9 Shutting Down

The stove will normally shut down by itself as the fuel is consumed. In order to shut down the stove for other reasons, close the primary air controls (if open), then close the secondary air control. If the controls are left in this position, the fire will eventually go out. If you want to revive the fire it is recommended that the primary air controls are open first, and then open the secondary air controls.

Warning! - The stove will remain **very hot** for a considerable time after the fire has died down or been extinguished.

Notes: Warning!- Petroleum coke fuels or household waste must not be burnt on this appliance. Should any difficulties arise over fuel quality or suitability, consult your local approved fuel merchant.

6.10 Shut down for prolonged periods

If the stove is to be left unused for a long period of time then it should be given a thorough clean to remove ash and unburned fuel residues. To enable a good flow of air through the appliance to reduce condensation and subsequent damage, leave the air controls fully open. It is important that the flue connection, any appliance baffles or throat plates and the chimney are swept prior to lighting up after a prolonged shutdown period.

6.11 Maintenance

Inspect the inside of the firebox and above the baffle plate every week during use. Where the chimney is believed to have previously served an open fire installation, it is possible that the higher flue gas temperature from the stove may loosen deposits that were previously firmly adhered, with the consequent risk of flue blockage. It is therefore recommended that the chimney be swept a second time within a month of regular use after installation. **See chimney cleaning section in section 3.1 Warnings and Important Information.** Inspect the inside of the stove and the flue ways and ensure

they are 100% clear after a period of disuse (e.g summer). **Only use manufacturers recommended replacement parts on the appliance.**

7.0 Safety Notes for your guidance

FIRES CAN BE DANGEROUS – Always use a fireguard to BS 8423:2002 Fireguards for use with solid fuel appliances in the presence of children, the elderly or the infirm.

DO NOT perform modifications to the appliance as this could seriously compromise safety in operation.

DO NOT OVERFIRE – it is possible to fire the stove beyond its design capacity, this could damage the stove, so watch for signs of over firing – if any part of the stove starts to glow red, including baffle plate or fuel retainer, the fire is in an over fire situation and the controls should be adjusted accordingly. Never leave the stove unattended for long periods without first adjusting the controls to a reduced and safe setting – **careful air supply control should be exercised at all times.**

WARNING – FUME EMISSION

Properly installed and operated, this appliance will not emit fumes. Occasional fumes from de-ashing and refuelling may occur which is not normally of serious concern.

However, persistent fume emission is potentially dangerous and must not be tolerated.

If fume emission does persist, then the following immediate action should be taken: -

1. Open doors and windows to ventilate room and leave the premises.
2. Let the fire out, or remove and safely dispose of fuel from the appliance.
3. Check for flue chimney blockage and clean if required.
4. Do not attempt to re-light the fire until the cause has been identified and corrected.

If necessary, seek professional advice from chimney or stove specialists.

Important! – Do not fit an extractor fan in the same room as this appliance.

IN THE EVENT OF A CHIMNEY FIRE

- Raise the alarm to let others in the house know.
- Call the Fire Service
- Reduce the appliance burning rate by closing all air controls fully.
- Move furniture and rugs away from the fireplace and remove any nearby ornaments.
- Place a fireguard or spark guard in front of the stove.
- Feel the chimneybreast for sign of excessive heat.
- Do not relight the fire until the chimney and flue ways have been examined by a professional.

If the wall is becoming hot, move the furniture away. Ensure that the Fire Service can gain access to your roof space in order to check this area for signs of fire spread.

CO ALARMS

Your installer should have fitted a CO alarm in the same room as the appliance. If the alarm sounds unexpectedly, follow the instructions given under “Warning Note” below. **WARNING** If the CO Alarm sounds unexpectedly:-

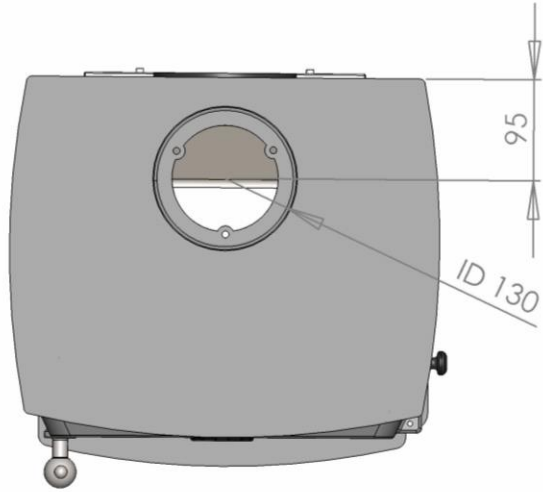

1. Open Doors and windows to ventilate the room and then leave the premises.
2. Let the fire go out.

9.0 Frequently Asked Questions

1 Do stoves require a chimney? All of our multi fuel and wood burning stoves require a suitable chimney or professionally installed flue system.

2 How do I clean the chimney? You will require a chimney sweep to clean the chimney. It is essential to provide a dedicated chimney cleaning access door when installing the flue of the stove in some situations. In the majority of situations the chimney can be swept through the firebox.

3 Who should install my stove? FDC want you to enjoy the maximum performance from your appliance. To ensure this, it is essential that they are installed correctly. We strongly recommend that your stove is installed by a suitably qualified installer e.g HETAS.

4 How do I regulate the heat output? Each stove has various air controls, which will allow you to easily regulate the heat output and refuelling rate.

5 What warranty do I get? FDC will replace, free of charge, any working part that fails (under normal operating conditions) within 12 months of purchase. Consumables such as glass, firebox liners or stove rope and adhesives are not guaranteed. An extended body warranty is available – see the pack in your new stove. **A call out charge will apply if our engineer attends any stove problem that is not related to product failure.**

6 Where can I get spare parts? Your local FDC stove retailer will be pleased to supply spare parts and to provide any other information you require. Alternatively contact FDC.

7 Can the doors be left open while burning? For safety and heat efficiency the doors should remain closed.

8 Why is the stove smoking when lit? A flue with back draught problems is almost certainly the cause of a smoking stove. Also check adequate ventilation is present. A qualified fitter should complete both a smoke pressure and flow test prior to fitting the stove to ascertain the integrity of the flue.

9 Why should I “Run in” my stove? To begin, light a series of small fires over a period of a few days to allow the paint finish to cure. The stove is finished with a highly heat resistant paint. The finish can be renovated with stove paint available from your local stove retailer or FDC. If the stove is not “run in” correctly, this may cause the paint to discolour and flake.

10 What is Over Firing? Your stove should never be used in a manner to cause over firing. Over firing can be caused by over loading the stove with fuel, and with primary controls open. If any part of stove glows "red" your stove is over firing and your draught control should be adjusted to restrict airflow to stove. Over firing can cause permanent damage to the appliance, which is not covered by warranty.
